

Why I like playing the Violin!

By Dimple Vijaykumar (Age 11)

I like playing the violin because it makes very blissful notes when I play. If I follow all the notes on the book correctly, I know that the music is very beautiful indeed. I'm sure that the people playing other string instruments like viola, cello and double bass will all agree with me. I don't think any kind of music would be very majestic unless played with a string instrument.

I am going to join the orchestra in my secondary school because I think it would be better if instruments were played in a group rather than alone. I am also going to perform in a duet or even a trio!

I like playing the violin because I know whenever, whatever and however I play on it, every time it'll sound very beautiful indeed!

Unlimited entertainment at your door steps

The ultimate place for Indian movies in the UK

Rent VCDs and DVDs in 4 languages:

I am Earth, Mother Earth

- Priya (Age 10)

I am the planet that is known to support life in the universe. I am here to tell you about what you don't see. What you cannot see

I have four layers. The crust, which you live on, is the first layer. It is the thinnest layer of all. The rocky mantle is the second layer. It is where the rock carbon turns into shimmering diamonds. Third is the bubbly hot outer core. This layer is made out of Iron and Nickel. The center, my heart is called the inner core.

The crust is like my face. It shows my emotions in the form of volcanoes, earthquakes and Tsunamis.

Let me explain.

Earthquakes : Oh yes, my frustrated mood. I am made out of plates - great slabs of earth. Some times when the plates scrape at each other, bits of rock get stuck between them. The two plates are stuck together. It builds up pressure. This pressure is strong enough to break the rocks, causing vibrations to spread around. The Vibrations cause the earthquake.

Volcanoes : Volcanoes are my angry mood. When two plates move together, some times one plate goes underneath the other. The underneath plate melts in to magma. When there is enough magma the volcano erupts. Also some times magma bursts out of weak spots in my crust. The magma is called lava when it comes out of the volcano.

Tsunamis: This is my sad mood. It is a very large ocean wave caused by an underwater earthquake or volcanic eruption.. A Tsunami is unnoticeable in deep waters. But as it comes closer to land the tsunami slows down and gets higher. They are like wave trains coming and hitting the coastal lines. My negative moods have a special way to change the geography on my crust. My negative moods help keep the balance.
